Abstract. With the rapid development of artificial intelligence technology, its application in multiple fields has achieved significant results. However, at the same time, the ethical issues of artificial intelligence have become increasingly prominent, especially the problem of technology abuse, which has brought many challenges to society and individuals. This article delves into the ethical issues brought about by the rapid development of artificial intelligence technology, especially the phenomenon of technology abuse. Issues such as cyber attacks, dissemination of false information, infringement of personal privacy, and impact on the job market. To address these issues, this article proposes measures such as strengthening the construction of laws and regulations, promoting the formulation and implementation of ethical norms, and strengthening regulatory efforts. By comprehensively utilizing legal, ethical, and regulatory measures, the aim is to promote the healthy development of artificial intelligence technology, protect personal privacy and social security, and achieve harmonious coexistence between technology and society. The research in this article is of great significance for promoting ethical construction and sustainable development in the field of artificial intelligence.

**Keywords:** Artificial Intelligence Ethics, Technology abuse, Legal and ethical norms, Privacy protection, sustainable development

# **1** INTRODUCTION

The abuse of artificial intelligence technology may manifest as an infringement of personal privacy, a threat to data security, and even have a negative impact on social stability. Therefore, how to effectively regulate and manage the use of artificial intelligence technology, prevent its abuse, has become an urgent problem to be solved. As an important base for cultivating future technological innovation talents, the role of higher education in artificial intelligence ethics education cannot be ignored.

# 2 THE PROBLEM AND IMPACT OF THE ABUSE OF ARTIFICIAL INTELLIGENCE TECHNOLOGY

#### (1) The phenomenon of abuse of artificial intelligence technology

In the digital age, the abuse of artificial intelligence technology is becoming increasingly prominent. Among them, privacy infringement has become a focus of public attention. With the continuous development of big data and algorithm technology, personal data has become an important resource for business competition. However, some unscrupulous individuals or enterprises illegally obtain, use, or even sell personal data using artificial intelligence technology for personal gain, seriously infringing on personal privacy rights<sup>[1]</sup>. In addition, security threats are also a major manifestation of the abuse of artificial intelligence technology. Hackers exploit vulnerabilities in artificial intelligence technology, launch network attacks, implant malicious software, steal sensitive information, and cause huge economic losses to individuals and businesses. More seriously, the misuse of artificial intelligence technology can also amplify social biases and discrimination. Algorithms may be influenced by data bias during the training process, leading to unfair outcomes in the decision-making process and further exacerbating social inequality.

### (2) The Harms of Abuse of Artificial Intelligence Technology

The abuse of artificial intelligence technology has caused serious violations of individual privacy rights. The misuse of personal data not only leads to privacy leakage, but also may trigger criminal activities such as identity theft and fraud. Meanwhile, the misuse of artificial intelligence technology also poses a potential threat to social security. The proliferation of cyber attacks and malicious software has disrupted normal social order and affected people's daily lives and work.

## ① Privacy infringement: personal data leakage and abuse

In the digital age, personal data has become a valuable resource and is widely used in various fields such as business and politics. However, this also provides an opportunity for criminals to take advantage of. They use artificial intelligence technology to illegally obtain, analyze, and even sell personal data, posing a serious threat to personal privacy. The leakage of personal data may not only lead to personal property damage, but also affect an individual's reputation and career development. More seriously, these data may also be used to commit criminal activities such as fraud and identity theft, causing incalculable losses to individuals.

#### **2** Security Threats: Network Attacks and Malware

The security threats brought about by the abuse of artificial intelligence technology cannot be ignored. With the rapid development of technology, hackers and malicious attackers are also constantly improving their attack methods. They exploit the vulnerabilities and deficiencies of artificial intelligence technology, launch network attacks, implant malicious software, attempt to steal sensitive information or disrupt the normal operation of the system. These attacks may not only cause economic losses to individuals and businesses, but also pose a threat to national security.

#### **③** Social Impact: The Amplification of Prejudice and Discrimination

The social impact brought about by the abuse of artificial intelligence technology cannot be ignored. Especially in terms of prejudice and discrimination, its amplification effect is becoming increasingly evident. During the training process, algorithms are often influenced by data biases, which may lead to unfair results in the decision-making process. This unfairness is not only reflected at the individual level, but may also lead to an exacerbation of social inequality<sup>[2]</sup>. For example, in key areas such as recruitment and education, if algorithms are influenced by biases such as gender and race, it may lead to unfair treatment of certain groups. This kind of unfairness not only violates the principles of social justice, but may also lead to social conflicts and contradictions.

# 3 THE PRACTICE STATUS OF ARTIFICIAL INTELLIGENCE ETHICS EDUCATION IN HIGHER EDUCATION

Although higher education has made some progress in artificial intelligence ethics education, there are still many shortcomings and challenges. In the future, we need to further strengthen the practice and exploration of artificial intelligence ethics education, continuously improve the quality of education, and lay a solid foundation for cultivating talents in the field of artificial intelligence with noble character and innovative spirit.

#### (1) From the perspective of curriculum design

More and more universities are paying attention to ethical education in artificial intelligence and incorporating it into their curriculum system. Some schools even offer specialized ethics courses to systematically explain the ethical issues of artificial intelligence technology. However, there are still some schools that do not attach enough importance to this, and the curriculum is not rich and in-depth enough, resulting in students having difficulty fully understanding the ethical connotations of artificial intelligence technology.

#### (2) From the perspective of teaching methods

Some universities have adopted diverse teaching methods such as case teaching and group discussions to stimulate students' interest and enthusiasm in learning. At the same time, some schools have also introduced simulations of actual ethical dilemmas, allowing students to learn how to make correct ethical decisions in practice. However, there are still some schools whose teaching methods are relatively single and lack innovation, making it difficult to achieve good teaching results.

#### (3) From the perspective of teaching staff

Although some universities already have a group of teachers with the ability to educate on artificial intelligence ethics, overall it is still insufficient. Some teachers lack professional knowledge and practical experience in related fields, making it difficult to effectively impart ethical knowledge of artificial intelligence. In addition, there is a lack of sufficient support and investment in teacher training and further education, which makes it difficult to improve the teaching staff. As show in figure 1.

Fig. 1. Issues and Impacts of Abusive Use of Artificial Intelligence Technology

# 4 EXPLORATION AND INNOVATION OF ARTIFICIAL INTELLIGENCE ETHICS EDUCATION IN HIGHER EDUCATION

The best practice of artificial intelligence ethics education in higher education curriculum design should be diversified, including the combination of theory and practice, the integration of traditional education and modern technology, and the cultivation of students' critical thinking and innovation abilities.

### (1) The Development of "Craftsman Spirit" in the Education Process of Vocational Colleges

#### **(1)Integrated teaching:**

In higher education, the integration of artificial intelligence ethics education and curriculum has become a key point of educational innovation. By introducing specific ethical issues into the classroom, not only can it stimulate students' thinking, but it can also guide them to deeply understand and abide by ethical norms while mastering technology. Combining with China's profound tradition of ideological and political education, this integrated teaching helps cultivate a new generation of talents who possess both technical literacy and noble moral character. This innovative measure not only enriches the teaching content, but also provides students with a more comprehensive and threedimensional learning experience, laying a solid foundation for building a comprehensive and targeted education system.

### **2**Building an adaptive artificial intelligence model:

It is crucial to construct an AI model that is compatible with moral education in artificial intelligence ethics education. This model not only focuses on imparting knowledge, but also emphasizes the cultivation of student habits and the practice of moral behavior. By simulating moral situations, enhancing human-computer interaction, and combining adaptive learning techniques, students can feel and understand the importance of moral behavior in practical operations. The innovation of this teaching model not only enhances students' interest in learning, but also effectively promotes the formation of their moral behavior, providing strong support for cultivating future social pillars with noble moral sentiments.

#### **③**The application of debate based teaching methods:

The application of debate based teaching methods in artificial intelligence ethics education provides students with a platform for in-depth thinking and extensive communication. Through debate, students can delve deeper into the complex issues of artificial intelligence ethics, exercise critical thinking, and improve problem-solving abilities. This teaching method not only helps to cultivate students' ethical awareness and concepts, but also enhances their communication and teamwork abilities. At the same time, debate based teaching also provides students with an opportunity to showcase and challenge themselves, allowing them to constantly grow in the midst of intense intellectual collisions.

#### **(Delta Delta State and St**

In artificial intelligence ethics education, emphasizing the introduction of historical origins and governance situations is crucial for a comprehensive understanding of this field. By sorting out the development history of artificial intelligence ethics, students can have a clearer understanding of the close relationship between ethical issues and technological progress, and understand the challenges and response strategies faced at different historical stages<sup>[3]</sup>. At the same time, a brief introduction to governance can also help students understand the current social concerns and solutions to ethical issues related to artificial intelligence. This comprehensive teaching helps cultivate students to form systematic ethical concepts and improve their ability to deal with complex problems in practice.

#### **⑤**Personalized learning and evaluation:

The application of personalized learning and evaluation in artificial intelligence ethics education has greatly improved teaching effectiveness. With the help of artificial intelligence technology, teachers can provide customized teaching content and methods based on the learning characteristics and needs of students, ensuring that each student can receive suitable learning resources and guidance<sup>[4]</sup>. Meanwhile, through an intelligent evaluation system, teachers can track students' learning progress and performance in real time, discover and solve problems in a timely manner. This personalized teaching model not only improves student learning efficiency and interest, but also provides teachers with more accurate and comprehensive teaching feedback, which helps to continuously optimize the teaching process and improve teaching quality. As show in figure 2.

Fig. 2. Exploration and Innovation in AI Ethics Education in Higher Education

### 5 CONCLUSION AND OUTLOOK

We have achieved significant results through the exploration and innovation of artificial intelligence ethics education in higher education. Our unique teaching system is composed of integrated teaching, adaptive artificial intelligence models, application of debate based teaching methods, emphasis on historical origins and governance, and personalized learning and evaluation practices. This system not only enhances students' moral qualities and ethical awareness, but also cultivates their critical thinking and teamwork abilities, laying a solid foundation for their future career development and social contributions.

Looking ahead, we will continue to deepen the exploration and innovation of artificial intelligence ethics education. We will further improve the teaching system, optimize teaching methods and means, and improve teaching effectiveness and quality. At the same time, we will also pay attention to the latest developments and social application trends of artificial intelligence technology, adjust teaching content and focus in a timely manner<sup>[5]</sup>, and ensure that our education always stays at the forefront of the times. We believe that in the near future, our educational achievements will cultivate more outstanding talents with noble moral character and excellent technical ability for society, and make greater contributions to promoting the healthy development of artificial intelligence technology and social progress.
